

Functional Testing Services

FCS focuses software testing on validating business requirements, rather than just testing software. Our experienced professionals bring an "engineering" approach to the testing, which makes the right balance of methodology, process and approach to suite every client need. Functional testing services in FCS ensure product quality, while reducing both time-to-market and cost of testing.

Our Approach:

FCS Functional Test Approach is based on Requirement Specifications, Functions/ Features, Use cases, Code and data where the focus is to have almost a destructive attitude. Test not only the design but also the overall system behavior and provide the comfort level over the intended business purpose of the system.

End-to-End testing Services

We provide complete testing services, from testing/analyzing requirements to test execution, with elaborate reporting and management. Execute business functions and infrastructure management (i.e.; batch processing, system security features etc.) in an isolated and controlled environment to validate that a quality system is ready for production.

System Integration Testing Services

FCS System Integration Testing services are designed to:

- Prove that the technical structure of the system architecture is complete and functional and to prove the interoperability of all of the system components
- Test the functional aspects and the end-to-end functionality of each of the components that make up a complete system
- Test the functionality of a system against its requirements as well as ensuring that it performs within the stated parameters
- Test the correct interaction of the system under test with one or more other systems in a common environment

User Acceptance Testing Services:

FCS UAT services help software vendors and business software users assure themselves that their software is functionally fit for purpose and meet end-users functional requirements. We assist in UAT design, execution and production support.

Features:

FCS Functional Testing services include:

- End-to-End Testing
- System Integration Testing
- User Acceptance Testing

Key Benefits:

- Custom testing approach and processes to meet a broad range of development methodologies.
- Considerable test coverage as per functional requirement and business perspective.
- Committed testing professionals with proven expertise in test planning, building test strategy and test execution techniques.
- Analytical Status reporting for Test design , Test Execution, Defect Management, Overall Status before release.
- Customer-centric innovations across areas such as metrics, automation and test organization
- Deep client engagement providing end-to-end services to global clients
